

APPENDIX

Client Feedback

Questions and Responses:

Q: Are you able to successfully add and remove Users?

A: Yes, adding and removing users is a trivial task.

Q. Is the System stable enough for your needs?

A: Yes, I find the system adequately stable as it throws relevant error warnings and prevents abnormal actions

Q. Is the User Interface self-explanatory and easy to navigate?

A: Yes, the User interface is laid out in a clean and intuitive manner. It is easy to use the software without any prior tutorial.

Q. Does the program maintain compatibility with your systems?

A: Yes, our systems have python 3.7 installed and manage to run the program without any hiccups.

Q. Does the program satisfy your need for being lightweight and memory efficient?

A: Yes, the program runs well within the 1 GiB ram limit of our older systems.

Q. Did you find any discrepancies in the User interface while navigating the program?

A: None of any concern, however success and failure error messages show up twice in some areas of the program – once in the message box and once in the window itself. Other than that, everything looks good.

Q. Do you have any recommendations for further development of this program?

A: This program can improve if it implements a more robust security model. Hashed passwords are adequate, but bad actors can still read and write to other users logs if permissions are not configured properly. Also, compatibility and accessibility can be improved by hosting the website on a server.
